

# Basic Information

When talking about EasyConf Control, we describe the various forms this application can take to provide a **GUI** (graphical user interface) for the EasyConf and EasyCam background applications.

EasyConf Control can be installed together with the main applications on the same server system but it can also run on a different PC/mobile device to provide an additional point of control. It will show a GUI based on the Templates created with the **Template Editor** in EasyConf.

EasyConf Control is also used as a mechanism to display information on Hall Displays. Using the settings in EasyConf, the templates running in a specific EasyConf instance can be changed, updated, triggered by an event taking place during a meeting such as starting or stopping a meeting, a voting session or an agenda point.

Please see the EasyConf section about **EasyConf Control and EasyCam clients** to get more information on this subject. Also, please see the subsections of this menu for specific details about the systems we can run EasyConf Control on.

**Note:** To receive the video stream on mobile devices such as Android or iOS, the feature **Streaming to remote devices** in the EasyCam Video Outputs tab must be enabled.
